

# Invitation for Thursday, 14<sup>th</sup> of August, NZISF seminar

(on ZOOM)

Event Details

## Seminar topic: Military Cyber Operations vs Cyber Security

- What is the military approach to cyber security?
- What are cyber operations, and how do they differ from cyber security?

In this talk, Austin will discuss the different environment that defines the military cyber domain, and how cyber operations work. He will also cover military cyber doctrine and the technical differences of operational technology.

## Presenter: Austin Chamberlain

Austin Chamberlain is a scientist with Defence Science and Technology, part of the New Zealand Defence Force.

Austin started his career as a system administrator working predominantly on web-facing systems. This provided a fast understanding of information security, and he focused increasingly on information and cyber security, making the jump to a cyber role in due course. He served part time in the British Army reserve, initially as a logistics officer, and later transferring to a cyber operations role. In his civilian career he has predominantly worked in the academic sector.

This combination of academia, technical and military cyber experience provided a strong foundation for a military cyber research role, and he now works on studying and integrating next generation and generation-beyond-next cyber capabilities into the NZDF.
