

Invitation for NZISF seminar on 12 February (on ZOOM)

Event Details

Seminar topic: From Door to Data: The Overlooked Role of Physical Security in Cyber Risk

Cybersecurity strategies often focus on digital controls, while physical security remains an underutilised layer of cyber defence. This presentation examines how electronic security system, including access control, CCTV, and biometric technologies, directly affect an organisation's exposure to cyber incidents, privacy breaches, and insider threats.

Using practical examples from public and private sector environments, the session highlights common points of failure where physical access enables cyber compromise, such as unauthorised network access, credential misuse, and device tampering. It explores how attackers exploit gaps between physical security, cybersecurity, and governance — and why treating these domains in isolation increases overall risk.

Attendees will gain clear, actionable insights into how integrating physical security into cyber risk management and privacy-by-design frameworks can reduce breach likelihood, improve incident detection, and strengthen organisational resilience. The session reinforces a critical message for security leaders: effective cybersecurity does not start at the firewall. It starts at the door.

Presenter: Reck Diogo

Reck held senior roles including Sales and Marketing Manager, Operations Manager, and Operations and Risk Manager, leading complex security projects across both the public and private sectors. His experience includes the delivery of large-scale electronic security initiatives and the implementation of biometric and access control systems in regulated and high-risk environments.

Reck holds a Master's Degree in Communication and Media Studies and is an active industry contributor. He is Secretary of the ASIS New Zealand Chapter and a member of the NZ Security Association, participating in the Electronic Security, Privacy and Biometrics, and Future Leaders interest groups."
